Summary

C# and Python software engineer with 3+ years of experience. Builds the operations platform at a medical-device logistics company alongside the CTO, owning features end to end and working daily with IT, customer support, operations managers, and division managers. Full stack: .NET and Blazor, Python, PostgreSQL, Azure, and AI/LLM features.

Technical Skills

C# / .NET: .NET 10, ASP.NET Core, Blazor Server (MudBlazor, Radzen), Npgsql, xUnit, OpenXML, PDFsharp

Python: Flask, FastAPI, Django, Pandas, Pytest, automation and ETL scripts

Web & Data: JavaScript, React, Node.js, HTML/CSS, REST APIs, PostgreSQL, SQL, Power BI

Azure: App Service, Container Apps Jobs, Container Registry, Functions, API Management, Blob Storage, Entra ID

DevOps: Docker, Git, GitHub Actions CI/CD with OIDC, deployment slots, database migrations

AI & Integrations: LLM features (Anthropic Claude API, agentic tool use), Microsoft Graph, Twilio SMS, SFTP

Work Experience

GlobalMed Logistix | Software Engineer | Feb 2024 – Present

- Co-develop the company's operations platform with the CTO, **owning features end to end**: a C# / .NET 10 Blazor web app on PostgreSQL that replaced a legacy Python (Django) system for inventory, 3PL logistics, and KPIs.
- Built multiple **LLM-powered analytics tools** (Anthropic Claude API, agentic tool use) that generate KPI dashboards from plain-English requests, answer staff questions from company data, and speed up onboarding.
- Migrated scheduled workloads from always-on virtual machines to Docker containers on Azure Container Apps Jobs, cutting hosting costs **80%** and replacing manual server updates with automated, repeatable deployments.
- Automated shipment data processing with scheduled Python jobs on Azure, reducing manual work by **40%**; later ported seven of these jobs to .NET with an in-app control panel for health and run history.
- Replaced manual spreadsheet workflows with **validated data import pipelines** for inventory, orders, KPIs, and financials, and built PDF shipping labels and camera-based barcode scanning for the warehouse floor.
- Designed role-based access so each user sees only the pages and data they are allowed to, with 3PL customer data isolation **enforced in SQL**, and added Microsoft single sign-on (Entra ID).
- Integrated Microsoft 365 (Graph API), Twilio SMS, Paylocity (HR), and two warehouse/3PL APIs with caching and fallbacks for slow partners, plus an Azure API Management + Functions gateway for real-time partner tracking.
- Set up continuous deployment with **zero downtime**: nine GitHub Actions pipelines release to Azure App Service via staging slot swaps, with Data Protection keys shared in Blob Storage so users stay signed in through a swap.
- Ran **176 production database migrations**, each tested on a staging copy first, and wrote the cutover runbook that retired the legacy system; the codebase is backed by **1,844 automated xUnit tests**.

Engaj Media | Website Developer Intern | May 2023 – Dec 2023

- Delivered a high-performance React landing page in an Agile (Scrum) team, using lazy loading and component optimization to increase consultation requests by **35%**.

YongMen Law P.C. | Freelance Software Engineer | Dec 2022 – Mar 2023

- Automated client follow-up emails through the Mailchimp API, cutting manual follow-ups **30%**, and shipped UI/SEO fixes guided by Google Analytics that grew traffic **25%** month over month.

Education

App Academy | Full-Stack Software Engineering | Nov 2022

Georgia State University | Business Administration coursework | 2017
